

# ECE 345 / ME 380: Introduction to Control Systems

## Midterm #1

Dr. Oishi

Due October 2, 2020 by 11:59am

This midterm is open note, open book, and Matlab and electronic resources are allowed. **No communication of any sort regarding the content of the exam is allowed with anyone other than Dr. Oishi.**

For full credit, show all your work.

*Academic dishonesty is a violation of the UNM Student Code of Conduct. Students suspected of academic dishonesty will be referred for disciplinary action in accordance with University procedures.*

*By signing below, I affirm that I have completed the midterm independently, under the conditions stated above.*

**SOLUTIONS**

Student Name

Student ID #

Problem #	Actual points	Possible points
1		20
2		20
3		40
4		10
<b>Total:</b>		90

## 1 Warm Up (20 points)

Consider the dynamical system described by the transfer function  $G(s) = \frac{2}{s+4}$ , with input  $U(s)$  and output  $Y(s)$ .

1. (10 points) Find the output  $y(t)$  of the system in response to an input  $u(t) = e^{-2t} \cdot 1(t)$ .

$$\begin{aligned} y(t) &= \mathcal{L}^{-1} \{ Y(s) \} \\ &= \mathcal{L}^{-1} \{ G(s) \cdot U(s) \} \\ &= \mathcal{L}^{-1} \left\{ \underbrace{\frac{2}{s+4} \cdot \frac{1}{s+2}} \right\} \end{aligned}$$

$$\frac{2}{(s+4)(s+2)} = \frac{A}{s+4} + \frac{B}{s+2}$$

$$0 \cdot s + 2 = A(s+2) + B(s+4)$$

$$2 = (A+B)s + (2A+4B)$$

$$\Rightarrow A+B=0$$

$$2 = 2A+4B$$

$$A = -B$$

$$1 = A+2B$$

$$= -B+2B$$

$$A = -1 \quad \leftarrow \quad 1 = B$$

$$\therefore y(t) = \mathcal{L}^{-1} \left\{ \frac{-1}{s+4} + \frac{1}{s+2} \right\}$$

Continue to next page  $\rightarrow$

$$= \left( -e^{-4t} + e^{-2t} \right) \cdot 1(t)$$

Now consider a spacecraft module descending to the surface, that can be described by the equations of motion

$$M\ddot{y}(t) = k \cdot \dot{m}(t) - m(t)g \quad (1)$$

where  $m(t)$  is the mass of the module,  $g$  is the gravitational constant, and  $k, M$  are positive constants.

2. (10 points) Which one of the following correctly describes the system in state-space form,

with state vector  $x(t) = \begin{bmatrix} y(t) \\ \dot{y}(t) \\ m(t) \end{bmatrix}$ , input  $u(t) = \dot{m}(t)$ , and output  $y(t)$ ?  
 $\searrow \begin{bmatrix} x_1(t) \\ x_2(t) \\ x_3(t) \end{bmatrix}$

(a)  $A = \begin{bmatrix} 0 & 0 & 1 \\ -g/M & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix}$ ,  $B = \begin{bmatrix} 1 \\ 0 \\ k/M \end{bmatrix}$ ,  $C = [0 \ 0 \ 1]$ ,  $D = 0$ .

(b)  $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & -g/M \\ 0 & 0 & 0 \end{bmatrix}$ ,  $B = \begin{bmatrix} 0 \\ k/M \\ 1 \end{bmatrix}$ ,  $C = [0 \ 0 \ 0]$ ,  $D = 0$ .

(c)  $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & k/M \\ 0 & 0 & 0 \end{bmatrix}$ ,  $B = \begin{bmatrix} 0 \\ -g/M \\ 1 \end{bmatrix}$ ,  $C = [1 \ 0 \ 0]$ ,  $D = 0$ .

(d)  $A = \begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & -k/M \\ 0 & 0 & 1 \end{bmatrix}$ ,  $B = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$ ,  $C = [g/M \ 0 \ 0]$ ,  $D = 0$ .

$$\dot{x}(t) = \begin{bmatrix} \dot{y}(t) \\ \ddot{y}(t) \\ \dot{m}(t) \end{bmatrix} = \begin{bmatrix} x_2(t) \\ -g/M \cdot x_3(t) + k/M \cdot u(t) \\ u(t) \end{bmatrix}$$

$$= \underbrace{\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & -g/M \\ 0 & 0 & 0 \end{bmatrix}}_A x(t) + \underbrace{\begin{bmatrix} 0 \\ k/M \\ 0 \end{bmatrix}}_B u(t)$$

$$y(t) = x_1(t) = \underbrace{[1 \ 0 \ 0]}_C x(t) + \underbrace{0 \cdot u(t)}_D$$

## 2 MagLev Train (20 points)

Maglev trains use magnetic levitation to keep the train car suspended above the guideway, through magnets on the bottom of the guideway which attract magnets on the wraparound, which pull the vehicle up toward the guideway. A controller is required to stabilize the system, resulting in the block diagram:

- (10 points) Show that the block diagram above can be simplified to the transfer function

$$\frac{Y(s)}{I(s)} = \frac{K}{s^2 + 14s + K} \quad (2)$$

$$\frac{Y(s)}{I(s)} = \frac{KG(s)}{1 + KG(s)} = \frac{KN(s)}{D(s) + KN(s)} \quad \text{for } N(s) = 1, D(s) = s(s+14)$$

$$= \frac{K}{s^2 + 14s + K}$$

Continue to next page →

Recall that  $\frac{Y(s)}{I(s)} = \frac{K}{s^2 + 14s + K}$ .

2. (a) (5 points) Use the Final Value Theorem to compute the <sup>steady-state</sup> output response  ~~$y(t)$~~   <sup>$y_{ss}$</sup>  to a unit step input in  $i(t)$ .
- (b) (5 points) For what values of  $K > 0$  will the steady-state value be equal to 1?

(a)

$$\begin{aligned} y_{ss} &= \lim_{t \rightarrow \infty} y(t) \\ &= \lim_{s \rightarrow 0} sY(s) \\ &= \lim_{s \rightarrow 0} s \cdot \frac{K}{s^2 + 14s + K} \cdot \frac{1}{s} \\ &= \frac{K}{K} = 1 \end{aligned}$$

(b) Any value of  $K > 0$  will satisfy  $y_{ss} = 1$  since it is not dependent on  $K$ .

### 3 Mean arterial pressure control (40 points)

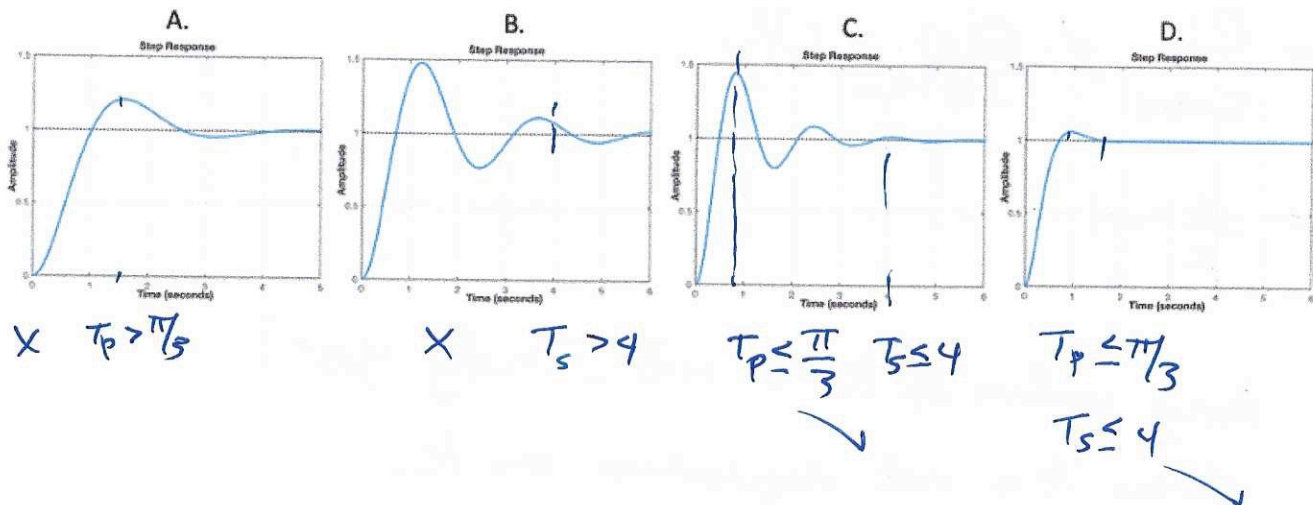

A system that controls mean arterial pressure can help anesthesiologists stabilize patients during surgery. We consider the design of such a system, in which the patient's hemodynamics are represented by

$$G(s) = \frac{4K}{s^2 + 2\sqrt{K}s + 4K} \quad (3)$$

with  $K > 0$  an unknown, positive constant. The system should satisfy the transient response characteristics: 1) settling time less or equal to than 4 seconds, and 2) peak time less than or equal to  $\frac{\pi}{3}$  seconds.

1. (10 points) Which of the following step responses depict *both* desired transient response characteristics? *More than one may be correct.*

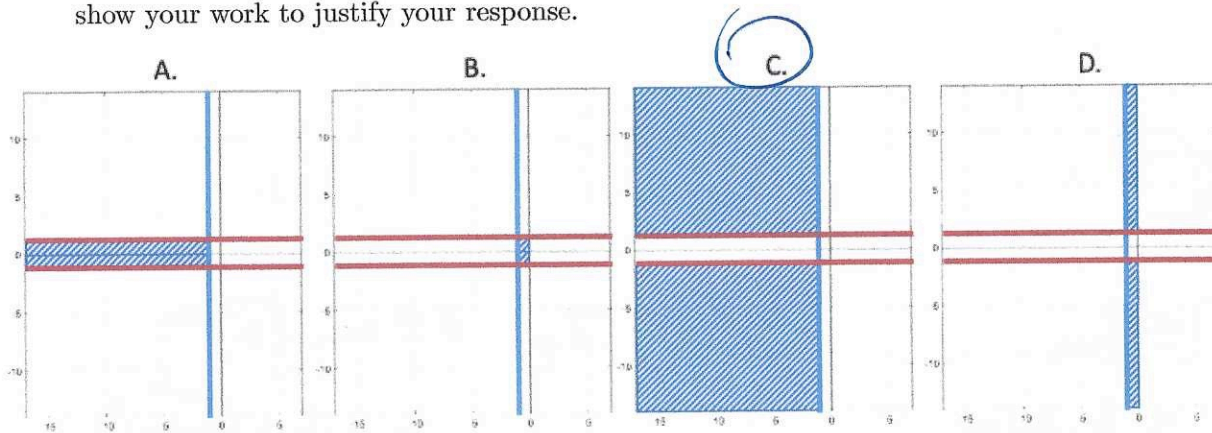

C & D are correct.

Continue to next page →

Recall that  $G(s) = \frac{4K}{s^2 + 2\sqrt{K}s + 4K}$ .

2. (10 points) Which one of the four plots below <sup>most</sup> accurately depicts all pole locations that would generate step responses that satisfy *both* transient response characteristics? For full credit, show your work to justify your response.

3. (10 points) Compute the damping ratio  $\zeta$  and the natural frequency  $\omega_n$  in terms of  $K$ . Which one of the following is true?

- (a) For high values of  $K > 0$ , the system is overdamped.
- (b) For low values of  $K > 0$ , the system is underdamped.
- (c) For low values of  $K > 0$ , the system is undamped.
- (d) The system is overdamped for all values of  $K > 0$ .
- ☒ (e) The system is underdamped for all values of  $K > 0$ .

2.  $T_s = \frac{4}{\omega_n} \leq 4$

$1 \leq \omega_n$  ← real part of poles

$T_p = \frac{\pi}{\omega_n \sqrt{1-\zeta^2}} \leq \frac{\pi}{3}$

$3 \leq \omega_n \sqrt{1-\zeta^2}$

← imag part of poles

∴ C is correct.

3.  $s^2 + 2\zeta\omega_n s + \omega_n^2$   
 $= s^2 + 2\sqrt{K}s + 4K$

$\Rightarrow 2\zeta\omega_n = \sqrt{K} \cdot 2, \quad \omega_n^2 = 4K$

$\omega_n = 2\sqrt{K}$   
 $\zeta = \frac{\sqrt{K}}{2\sqrt{K}}$

$\zeta = \frac{1}{2}$

→ independent of  $K$  and between 0 and 1

Continue to next page →

∴ underdamped

∴ E is correct.

Recall that  $G(s) = \frac{4K}{s^2 + 2\sqrt{K}s + 4K}$ .

4. (10 points) Which *one* of the following most correctly describes the restrictions on  $K$  that assures that both transient response requirements are met? Show your work for full credit.

- (a)  $1 \leq K$
- (b)  $1 \leq K \leq 3$
- (c)  $K \leq 3$
- (d)  $3 \leq K$
- (e) No value of  $K > 0$  will satisfy both requirements.

$$T_s: 1 \leq \zeta \omega_n$$

$$\leq \frac{1}{2} \cdot 2\sqrt{K}$$

$$1 \leq \sqrt{K}$$

$$1 \leq K$$

$$T_p: 3 \leq \omega_n \sqrt{1 - \zeta^2}$$

$$\leq 2\sqrt{K} \cdot \sqrt{1 - \left(\frac{1}{2}\right)^2}$$

$$\leq 2 \cdot \sqrt{K} \cdot \sqrt{\frac{3}{4}}$$

$$3 \leq \sqrt{3K}$$

$$9 \leq 3K$$

$$3 \leq K$$

for both of these to hold,

(d) is most correct.

Continue to next page →

#### 4 RLC Op-Amp Circuit / Spring-Mass-Damper System (10 points)

Choose one of the below systems to answer either 4A or 4B. You will not receive extra credit for doing both. If you do more than one problem, your highest score will be used.

(4A.) Spring mass damper system

(4B.) Op-amp circuit system

4A. (10 points) Find the mechanical system transfer function  $G(s) = \frac{Y(s)}{F(s)}$  with  $M = m = k = b = 1$  (dimensionless units), assuming initial conditions are 0.

4B. (10 points) Find the circuit transfer function  $G(s) = \frac{V_o(s)}{V(s)}$  with  $R_1 = R_2 = R = C = 1$  (dimensionless units), assuming initial conditions are 0.

4A. FBD: presume  $y-x > 0$   
 $\dot{y}-\dot{x} > 0$  for derivations only.

$$\sum F = M \ddot{x}$$

$$M \ddot{x} = +k(y-x) + b(\dot{y}-\dot{x}) + F(t)$$

$$Ms^2 X(s) = k(Y(s) - X(s)) + bs(Y(s) - X(s)) + F(s)$$

$$X(s)[s^2 + s + 1] = Y(s)[s + 1] + F(s)$$

$$Y(s) \frac{(s^2 + s + 1)^2}{(s + 1)} = Y(s)(s + 1) + F(s) \quad \leftarrow$$

$$Y(s) \left( \frac{(s^2 + s + 1)^2 - (s + 1)^2}{s + 1} \right) = F(s)$$

$$\frac{Y(s)}{F(s)} = \frac{s + 1}{s^4 + 2s^3 + 3s^2 + 2s + 1}$$

$$\sum F = m \ddot{y}$$

$$m \ddot{y} = -k(y-x) - b(\dot{y}-\dot{x})$$

$$ms^2 Y(s) = -k(Y(s) - X(s)) - bs(Y(s) - X(s))$$

$$Y(s)[s^2 + s + 1] = X(s)[s + 1]$$

$$Y(s) \frac{(s^2 + s + 1)}{(s + 1)} = X(s)$$

End of exam.

4B. KCL at node a:

$$\frac{0 - v_a}{R_2} = \frac{v_a - v_o}{R_1}$$

$$-2v_a = -v_o$$

$$v_a = \frac{v_o}{2} \Rightarrow V_a(s) = \frac{V_o(s)}{2}$$

KCL at node b:

$$\frac{v_s - v_b}{R} = C \frac{d}{dt} v_b$$

$$V_s(s) = (1 + RCs) V_b(s)$$

Ideal op-amp properties:  $V_a(s) = V_b(s)$

$$\therefore V_s(s) = (s+1) \frac{V_o(s)}{2}$$

$$\frac{2}{s+1} = \frac{V_o(s)}{V_s(s)}$$
