MIPS assembler directives

(From Computer Organization and Design - The Hardware/Software Interface by Dave Patterson and John Hennessy, 2nd edition)

SPIM supports a subset of the assembler directives provided by the actual MIPS assembler:

.align n	Align the next datum on a 2 ⁿ byte boundary. For example, .align 2 aligns the next value on a word boundaryalign 0 turns off automatic alignment of .half, .word, .float, and .double directives until the next .data or .kdata directive.
.ascii str	Store the string in memory, but do not null-terminate it.
.asciiz str	Store the string in memory and null-terminate it.
.byte b1,, bn	Store the <i>n</i> values in successive bytes of memory.
.data <addr></addr>	The following data items should be stored in the data segment. If the optional argument <i>addr</i> is present, the items are stored beginning at address <i>addr</i> .
.double d1,, dn	Store the n floating point double precision numbers in successive memory locations.
.extern sym size	Declare that the datum stored at sym is size bytes large and is a global symbol. This directive enables the assembler to store the datum in a portion of the data segment that is efficiently accessed via register \$9p.
.float f1,, fn	Store the n floating point single precision numbers in successive memory locations.
.globl sym	Declare that symbol sym is global and can be referenced from other files.
.half h1,, hn	Store the <i>n</i> 16-bit quantities in successive memory halfwords.
.kdata <addr></addr>	The following data items should be stored in the kernel data segment. If the optional argument <i>addr</i> is present, the items are stored beginning at address <i>addr</i> .
.ktext <addr></addr>	The next items are put in the kernel text segment. In SPIM, these items may only be instructions or words (see the .word directive below). If the optional argument <i>addr</i> is present, the items are stored beginning at address <i>addr</i> .
.space n	Allocate n bytes of space in the current segment (which must be the data segment in SPIM).
.text <addr></addr>	The next items are put in the user text segment. In SPIM, these items may only be instructions or words (see the .word directive below). If the optional argument <i>addr</i> is present, the items are stored beginning at address <i>addr</i> .
.word w1,, wn	Store the n 32-bit quantities in successive memory words. SPIM does not distinguish various parts of the data segment (.data, .rdata and .sdata).
