ECE520 – VLSI Design

Lecture 1: Introduction to VLSI Technology

Payman Zarkesh-Ha

Office: ECE Bldg. 230B
Office hours: Wednesday 2:00-3:00PM or by appointment
E-mail: pzarkesh@unm.edu

Course Objectives

❑ **We will focus mainly on *CMOS integrated circuits***

❑ **There will be a design project assigned including:**

- **Schematic design using S-Edit**
- **Spice simulations and design verification**
- **Layout design using L-Edit (including LVS and DRC)**
- **Circuit extract and spice simulation (again)**

❑ **Project will be done by groups of 3-4 students**

❑ **Project grade will be based on:**

- **Quality of report**
- **Performance (speed/delay)**
- **Power dissipation**
- **Layout area**

❑ **There will be a 10% extra credit for any design that beats certain criteria for layout area, performance, or power consumption**

Textbook and References

❑ **Main textbook:**

- **"Digital Integrated Circuits" by J. M. Rabaey et al. (2nd edition)**

❑ **Other reference books:**

- **"Physical Design of CMOS Integrated Circuits Using L-Edit" by J. Uyemura**
- **"Design of High-Performance Microprocessor Circuits", by A. Chandrakasan**

❑ **Lecture Notes: combination of slides and discussions**

- **Slides will be posted on the class webpage**
- **Class webpage: *www.unm.edu/~pzarkesh/ECE520***

❑ **Reference papers posted on the class webpage**

Grading Policy

❑ **Your grade in the course will be comprised of:**

- **Homework**   **(25%)**
- **Project**   **(25%)**
- **Midterm Exam**   **(25%)**
- **Final Exam**   **(25%)**

❑ **Final letter grade will be based on curve and class performance**
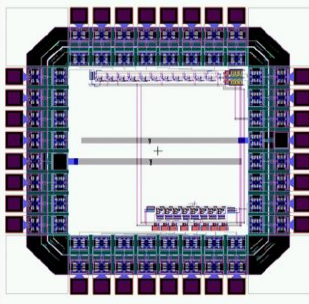

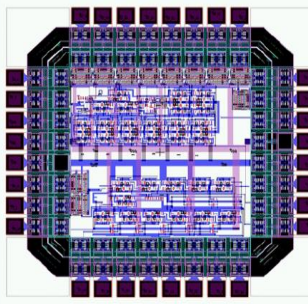

❑ **No makeup exam**

Homework Policy

❑ **Homework will be on weekly basis and is setup for the project**

- **Learn CAD tools and basic circuits**
- **Require lab work**

❑ **Solutions will be posted on the class website as soon as I can**

❑ **Late homework and projects have 20% per day credit penalty**

Class Project & Tools

❑ **Use of CAD tools will be required for most assignments. Get yourself familiarized with the tools from today!**

❑ **This is a project-oriented course. Be prepared for extensive lab work!**

❑ **We will be using L-Edit for our VLSI project**
  - **all Tanner tools including L-Edit, S-Edit, T-SPICE, LVS, and W-Edit are installed on all machines in ECE 211 Lab**
  - **The tools can also be installed on your own computer for the project use**
  - **for more information about these tools, please visit class website**

❑ **We will be using 0.5 um ON Semiconductor for our process**
  - **Selected projects will be submitted for manufacturing by MOSIS, if it becomes available on time**
  - **for more information about this process please visit https://themosisservice.com/university-support**

# Projects Manufactured by MOSIS in 2009

Projects Manufactured by MOSIS in 2012

Selected Design By: Javad Ghasemi

Class Schedule

Date	Day	Topic	Reading/Coverage
January 18	Tue	Introduction to VLSI Technology	1.1-1.3
January 20	Thr	Basic MOS Physics I (static)	3.2
January 25	Tue	Basic MOS Physics II (dynamic)	3.3
January 27	Thr	Device Scaling Issues	3.4-3.5
February 1	Tue	Device Scaling Issues - cont.	3.4-3.5
February 3	Thr	Basic CMOS Inverter	5.1.4
February 8	Tue	Basic CMOS Inverter - cont.	5.1-5.4
February 10	Thr	Dynamic Behavior of CMOS Inverter	5.4-5.6
February 15	Tue	CMOS Manufacturing Process	2.1-2.3, 2.4 (review), 2.5
February 17	Thr	Interconnect Manufacturing & Modeling	4.1-4.5
February 22	Tue	Design Rules	2.3, insert A
February 24	Thr	Layout Techniques & L-Edit Demo	handouts
March 1	Tue	Combinational Static Logic	6.1-6.2
March 3	Thr	Gate Sizing (Inveter Chain)	5.4
March 8	Tue	Gate Sizing (Inveter Chain) - cont.	5.4
March 10	Tue	**Midterm Exam**	-
March 15	Tue	Spring Break	-
March 17	Thr	Spring Break	-
March 22	Tue	Logical Effort	6.1 - 6.2
March 24	Thr	Logical Effort - cont.	6.1 - 6.2
March 29	Tue	Pseudo Logic and Pass-Transistor Logic	6.2
March 31	Thr	Project Review	-
April 5	Tue	Dynamic Logic	6.3
April 7	Thr	Advanced topics: Power Reduction	Handout
April 12	Tue	Sequential Logic	7.1-7.2
April 14	Thr	Sequential Logic - cont.	7.1-7.2
April 19	Tue	Timing Issues	10.1-10.2
April 21	Thr	Clock Distribution - PLL	10.3
April 26	Tue	Power Distribution & I/O Circuits	9.1-9.4
April 28	Thr	Memories	12.1-12.2
May 3	Tue	Nonvolatile Memories	12.2
May 5	Thr	SRAM Memories & Review for Final	Project Due
May 10	Tue	**Final Exam (12:30-2:30PM)**	-

Reading Assignment

❑ **Today we will review Chapter 1 and some more**

  ● **Introduction and history**

❑ **Our next class will be on Chapter 3 (MOS Physics)**

  ● **Skim through Diodes but focus on Section 3.2.3 (diode transient behavior)**

  ● **Study Section 3.3 (MOS transistor)** *thoroughly*

❑ **We will get back to Chapter 2 (Manufacturing Process) later**

VLSI Design Flow

❑ **The goal of VLSI designers is to design a circuit block that meets the following objectives:**

- **Maximize speed or performance**
- **Minimize power consumption**
- **Minimize area**
- **Maximized robustness**

❑ **Methods that they use are:**

- **Circuit design, transistor sizing**
- **Use of new architectures, clock gating, etc**
- **Choice of circuit style, efficient layout design**
- **Interconnect design and optimization**

VLSI Design Approaches

❑ **Gate Arrays (Old technology, but still attractive)**

- **Pre-fabricated chips containing transistors and local wiring**
- **Upper-level wires added to implement design**
- **Rapid design, but very sub-optimal, slow, and usually high-power consumption**

❑ **Standard Cells (Used for ASIC design)**

- **Cells in a library with fixed sizes**
- **Cells pre-characterized for delay and power**
- **Design is fast and layout is done automatically**
- **Better performance, in the range of several 100's MHz**

❑ **Custom Design (Used for Microprocessor design)**

- **Optimal circuit design and sizes**
- **Extensive design verification required**
- **Slowest, but densest layout design**
- **Best performance, in the range of 1-5 GHz**

VLSI Design Tools

❑ **Synthesis**

- **Logic, micro-architecture, automatic physical generation**

❑ **Static Analysis**

- **Design rule checking (DRC)**
- **Circuit extraction**
- **Timing analysis**
- **Test generation (ATPG)**

❑ **Dynamic Analysis**

- **Architectural simulation**
- **Logic simulation**
- **Circuit simulation (SPICE)**
- **Test verification**

High Level VLSI Design Steps

System Requirements ⟶ Logic Design & Synthesis

VLSI Design & Layout

Design Verification

Pass

Mask Generation

Silicon Manufacturing Process

Wafer Test (sort)

Package

Final Test
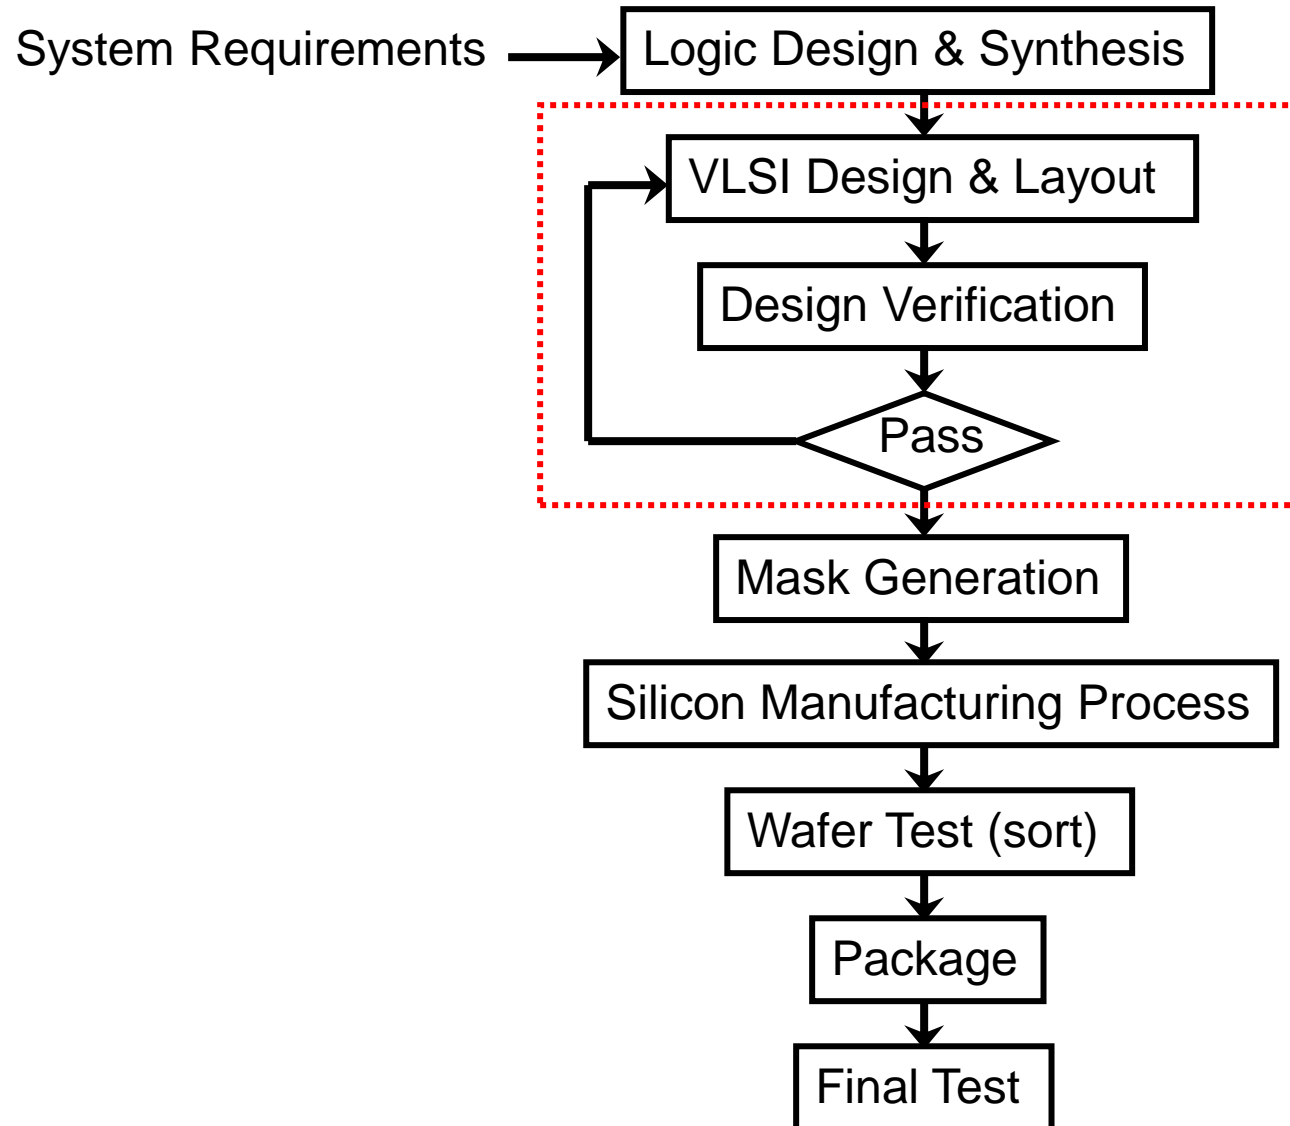

Introduction

Beginning of the Computer: ENIAC, the first electronic computer (1946)
- 333 integer multiplication/second

- A six-week run was equivalent to 100 person-years of manual computation

- Program resides in the wired connections

Intel 4004 Microprocessor
- 1971

- 10 um NMOS-only

- 2300 transistors

- 1 MHz

Intel Technology Advancement

Processor Comparison

Intel® i8088

Intel® Pentium® 4 Processor with HT Technology

Year: 1981
29,000 transistors

Year: 2004
125,000,000 transistors

Moore's Law

❑ **In 1965, Gordon Moore (founder of Intel) had a very interesting observation. He noticed that the number of transistors on a chip doubled every 18 to 24 months.**

❑ **He made a prediction that semiconductor technology would double its effectiveness every 18 months.**

Moore's Law for Intel Microprocessors
Source: www.intel.com

Moore's Law in Travel Industry

1978
Approximate Cost: **$900**
Approximate Travel Time: **7 hours**

2003
Approximate Cost: **1¢**
Approximate Travel Time: **¼ second**

Projected Wafer in 2000, circa 1975

57"
Moore was not always accurate

Die Size Growth
Die size has grown by 14% to satisfy Moor's law, **_BUT_** the growth is almost stopped because of manufacturing and cost issues

Clock Frequency
Lead microprocessors frequency doubles every 2 year, _BUT_ the growth is slower because of power dissipation issue

CMOS Scaling Scenario
CMOS Scaling Calculation
The Prediction of Foundry Market
Cost of Design versus Technology Node
Transistor Fin Improvement
22 nm 1st Generation Tri-gate Transistor
14 nm 2nd Generation Tri-gate Transistor

65nm SRAM Memory Cell
10 million of these transistors could fit in a square millimeter – about the size of the tip of a ballpoint pen
MOS in 65nm of Core Due Processor
Intel strained silicon (top) and a 65-nm wafer of Intel® Core™ Duo processors (bottom).

Distance between Si atoms = 5.43 ºA

No. of atoms in channel = 35 nm / 0.543 nm

= 64 Atoms!

Problem: Uncertainty in transistor behavior and difficult to control variation!

Gate Insulator Thickness

Problem: Electrons can easily jump over the 5 atomic layers!

This is known as leakage current

Benefit of Smaller Transistors

1) **More transistors in the same foot-print**

2) **More functionality**

3) **Reduced cost per function**

4) **Faster devices and higher performance**

5) **Lower switching energy per transistor**

Transistor Scaling Challenges

1) Feature sizes down to few atomic layers

2) Increase uncertainty of transistor behavior

3) Increase leakage power consumption

4) Difficult to maintain performance enhancement

5) Thermal limit issue

New Method to Deal with Scaling

New Materials and Device Structures Extending Transistor Scaling

Changes Made

Gate
Silicide Added

Channel
Strained Silicon

Future Options

High-k Gate Dielectric

New Transistor Structure
Transistor

Far-future Alternative Logic Devices

1) **Spintronics (spin-based electronics)**

2) **Quantum Computing**

3) **DNA Computing**

4) **Optical Computing**

Power Dissipation

Lead microprocessors power dissipation continue to increase, _BUT_ it is getting too hard (and expensive) to keep up
Power Density Problem
Power density too high to keep junction at low temperature. Power reaching limits of air cooling.

Heat Management Consideration

Power Consumption Scenario

Some Calculations!

Power = 115 Watts

Supply Voltage = 1.2 V

Supply Current = 115 W / 1.2 V   = 96 Amps!

Problem: Current density becomes a serious problem!

This is known as electromigration

Note: Fuses used for household appliances = 15 to 40 Amps

Another Calculations!

Power = 115 Watts

Chip Area = 2.2 Cm^2

Heat Flux = 115 W / 2.2 Cm^2 = 50 W/Cm^2 !

Problem: Heat flux is another serious issue!

Notes:
> **Heat flux in iron = 0.2 W/Cm^2**
> **Heat flux in frying pan = 10 W/Cm^2**

Method of Heat Management

1) Proper heat removal system (expensive)

2) Improve manufacturing for low power MOS

3) Architectural solutions (multi-cores)

Hitachi Water Cooling Laptop

Reservoir Tank

Flexible Tube

Manufacturing Solution
Architectural Solution
Compatibility and Stability
Quad-Core and Dual-Core Intel® Xeon® processors can be integrated into a single, advanced technology server platform.

Dual-Core

Quad-Core

Architectural Solution

Interconnect Architecture
Metal stack over Silicon
Real wiring cross section photograph

Interconnect Scaling Scenario

Technology	45 nm (2008)	35 nm (2010)	22 nm (2012)
Wire width	45 nm	32 nm	22 nm
Wire Thickness	80 nm	60 nm	40 nm
Total Number of Wires	150 Million	300 Million	600 Million
Total wire length	1.4 mile	2 mile	2.8 mile

Delay versus Interconnect Scaling
$$\text{Delay} \propto R_{int} \, C_b$$

Interconnect versus Gate Delay
Interconnect Challenges

1) **Slows down with scaling**

2) **Consume more power**

3) **Generate more heat**

4) **Electromigration**

# *Far-future Alternative Interconnects*

1) **Carbon nanotubes**

2) **Optical Interconnect**

3) **Molecular wires**

4) **Spintronics interconnect system**
Process Defects and Yield Loss

## Process Defect Causing Fault (Short)

**Original layout**

**A particle or
a process defect**

Short defect

Process Defect Causing Fault (Opens)

Original layout

**A particle or
a process defect**

open defect

Process Defect Photograph
Open Circuit
Short Circuit

Manufacturing Issues

1) **Smaller feature size requires ultra-clean manufacturing facility (expensive)**

2) **Because of the increase in complexity, defects could drastically reduces the manufacturing yield (% of working chips)**

3) **There are much more issues related to "Design for Manufacturability" (DFM)**

Die Cost
Single die

Wafer

Going up to 12″ (30cm)

From http://www.amd.com

Cost per Transistor

cost:
¢-per-transistor

Fabrication capital cost per transistor (Moore's law)
Cost per transistor is reducing exponentially following Moor's law.

Yield

$$Y = \frac{\text{No. of good chips per wafer}}{\text{Total number of chips per wafer}} \times 100\%$$

$$\text{Die cost} = \frac{\text{Wafer cost}}{\text{Dies per wafer} \times \text{Die yield}}$$

$$\text{Dies per wafer} = \frac{\pi \times (\text{wafer diameter}/2)^2}{\text{die area}} - \frac{\pi \times \text{wafer diameter}}{\sqrt{2 \times \text{die area}}}$$
Defects and Die Cost
$$\text{die yield} = \left(1 + \frac{\text{defects per unit area} \times \text{die area}}{\alpha} \right)^{-\alpha}$$

$$\alpha \text{ is approximately } 3$$

$$\text{die cost} = f\,(\text{die area})^4$$

Some Examples (1994)

Chip	Metal layers	Line width	Wafer cost	Def./ cm²	Area mm²	Dies/ wafer	Yield	Die cost
386DX	2	0.90	$900	1.0	43	360	71%	$4
486 DX2	3	0.80	$1200	1.0	81	181	54%	$12
Power PC 601	4	0.80	$1700	1.3	121	115	28%	$53
HP PA 7100	3	0.80	$1300	1.0	196	66	27%	$73
DEC Alpha	3	0.70	$1500	1.2	234	53	19%	$149
Super Sparc	3	0.70	$1700	1.6	256	48	13%	$272
Pentium	3	0.80	$1500	1.5	296	40	9%	$417

Summary

Digital IC Business is Unique

Things Get Better Every Few Years

Companies Have to Stay on Moore's Law Curve to Survive

Benefits of Transistor Scaling

Higher Frequencies of Operation

Massive Functional Units, Increasing On-Die Memory

Cost/Functionality Going Down

Downside of Transistor Scaling

Power (Dynamic and Static)

Design and Manufacturing Cost

….
